Manya Jain

Tempe, AZ (Open to Relocation) | 480-637-1065 | manyajainrkm@gmail.com | linkedin.com/in/manya-jainn | github.com/ManyaJainrkm

Education

Arizona State University — Tempe, AZ
Master of Science in Computer Science, GPA: 3.50/4.00 — Expected May 2027
Coursework: Data Structures & Algorithms, Statistical Machine Learning, Agentic AI, Mobile Computing, Info Security

Manipal University Jaipur — Jaipur, India
Bachelor of Technology in Computer Engineering — May 2025

Technical Skills

Languages: Python, Java, C++, C, TypeScript, JavaScript, SQL, Bash
Backend & Web: Node.js, FastAPI, REST APIs, React, TanStack Start, JSON Schema, HTML/CSS
DevOps & Infrastructure: Linux, Docker, Kubernetes, Jenkins, Continuous Integration (CI/CD), Git, Prometheus, Grafana
Databases: PostgreSQL, MySQL, Snowflake, Redis, Neo4j (Cypher)
AI & ML: LLM APIs (OpenAI), Snowflake Cortex, Agentic Workflows, RAG, LangChain, LLM Evaluation, scikit-learn
Engineering: Object-Oriented Programming, Debugging, Regression Testing, Code Review, AI-Assisted Development

Experience

Safexpress Private Limited — Gurugram, India
Software Engineer Intern, GenAI — May 2026 - Aug 2026

- Engineered configuration-driven behavior across 4 skills (Orchestration, Response, Sales, Geo-Disambiguation) of a Snowflake Cortex text-to-SQL BI agent deployed on Slack, shipping 15+ documented fixes in 6 weeks
- Debugged live-agent failures (geo-disambiguation misfires, skipped waybill filters, leaked internal reasoning, broken output contracts) with functional and regression tests, logging every prompt-to-fix change
- Caught a data-integrity bug where cancelled and void transactions leaked into reported sales results, and restructured rule enforcement in the skill files to exclude invalid records
- Built a reusable 7-script Python pipeline (pandas, scikit-learn, SciPy) reducing 29,000+ interaction logs to 3,257 unique questions, then clustered intents with TF-IDF and K-means to measure 77.5% skill coverage ($p < 0.001$)
- Verified agent-generated logic with independent Snowflake SQL (CTEs, window functions, anti-joins) and delivered a frequency-ranked gap list with an implementation guide for each gap category

CIPS-AI Lab, Arizona State University — Tempe, AZ
Student Researcher — Feb 2026 - Sep 2026

- Wrote an experiment harness testing whether n-gram TF-IDF recovers multi-word legal terms that unigrams split, comparing 3 classifiers (5-fold CV, macro F1) on 580+ SEC cases on ASU's Sol HPC cluster (SLURM)
- Prototyped a Neo4j knowledge graph linking cases, firms, statutes, and metadata for Cypher-based relational retrieval, and presented it at a lab meeting

National Institute of Urban Affairs, Govt. of India — New Delhi, India
Software Engineering Intern, DevOps & Platform Systems — Aug 2024 - May 2025

- Built and maintained Jenkins CI/CD pipelines for 12+ containerized services on the UPYOG urban governance platform, adding build validation, configuration checks, and deployment gating that improved release reliability by 30%
- Managed Docker and Kubernetes (K3s) deployments and built Prometheus and Grafana dashboards for service health
- Debugged Java service failures (Maven, WildFly) and traced Linux, container, and OAuth2-Proxy authentication issues through logs and service state, cutting incident recovery time by 25%

Projects

FirstHour: Camera-Free Fall-Response System | **2nd Place x2 (StepFun, Espressif), LA Hacks 2026** — Oct 2026
TypeScript, Node.js, Python, FastAPI, Photon iMessage API, ElevenLabs

- Built the TypeScript messaging gateway on Photon's iMessage API that sends fall-triage alerts to caregivers and returns their live replies to the FastAPI backend in 3.5 seconds
- Made inbound delivery restart-safe and idempotent: a persisted cursor advances only after the backend accepts each reply and message IDs deduplicate replays, so a gateway restart mid-incident loses no replies
- Reproduced two thread-pool starvation bugs that silently discarded LLM output under load; minimal repros drove the fix to separate worker pools and single-flight triage
- Code-reviewed a Devin-built caregiver coordinator and led the pitch and demo for a 3-person, 24-hour build

Sage: Verified AI Career-Gap Analyzer | OpenAI Build Week — Jul 2026
TypeScript, React, TanStack Start, Node.js, OpenAI Responses API, JSON Schema, Render

- Built and deployed a full-stack TypeScript app that compares resumes to job descriptions and ranks skill gaps
- Designed a multi-stage inference pipeline (browser-side PDF parsing, JSON Schema-constrained LLM output, deterministic validation, retry and fallback) that rejects model claims not supported by the source documents

Financial Transaction Fraud Detection Pipeline | CSE 543 — Aug 2026 - Present
Python, LightGBM, BiLSTM, SMOTE, SHAP/LIME

- Lead an 8-member graduate team building an explainable fraud classifier for highly imbalanced transaction data

Additional: Harmoneyes (MediaPipe gesture instrument) | F1 Race-Strategy Agent (FastF1) | Venn (embedding matching)
